

The **Mixer** slot is where attention / CoTAR / **MI (ours)** are swapped. The MI variants (v1–v4) are detailed below.

MI v1 — fixed PAC coupling as aggregation weights (no learned Q/K/V)

MI v3 — PAC-biased attention, *per-channel* coupling + seed-controlled (beats CoTAR 3/3 seeds)

MI v4 — multi-head + per-head pac_scale + gated injection (tried, no net gain, reverted)
